Flight Simulator X.

Crash to desk top Fix

It seems that after a update to windows Vista and 7, FSX has a tendency to Crash to the desktop and restart. Following the event viewer, and with help from various sources (specifically the FSpassengers forum) I (or we) found the cause. The before mention update modified the UiautomationCore.dll, and caused FSX to crash at random times when accessing the in game menu (ether by pressing ALT or right clicking). This includes the original DLL file before the update. In stall is easy, instructions are included.

Be aware that this will only fix the CTD error that's caused by this problem. Any other CTD error caused by another source will not be fixed.

In this Folder.
1. A thumb nail picture
2. This read me
3. DLL file

Installation
This part is actually so easy that it's sad.

All you have to do is simply cut the DLL file from its folder, and paste it the Root FSX directory.

C:\Program Files\Microsoft Games\Microsoft Flight Simulator X

That's it

Conclusions
I decided to upload this to a popular website for FS add-ons. That way, more people would be aware of the Fixes existence. And maybe the problem can be fix for everyone.

Happy Flying
